Customer Problem Statement Template

Create a problem statement to understand your customer's point of view. The Customer Problem Statement template helps you focus on what matters to create experiences people will love.

A well-articulated customer problem statement allows you and your team to find the ideal solution for the challenges your customers face. Throughout the process, you'll also be able to empathize with your customers, which helps you better understand how they perceive your product or service.

I am <i>Describe customer with 3-4 key characteristics - who are they?</i>	Describe the customer and their attributes here
I'm trying to <i>List their outcome or "job" they care about - what are they trying to achieve?</i>	List the thing they are trying to achieve here
but <i>Describe what problems or barriers stand in the way - what bothers them most?</i>	Describe the problems or barriers that get in the way here
because <i>Enter the "root cause" of why the problem or barrier exists - what needs to be solved?</i>	Describe the reason the problems or barriers exist
which makes me feel <i>Describe the emotions from the customer's point of view - how does it impact them emotionally?</i>	Describe the emotions that result from experiencing the problems or barriers

Problem Statements for Project: Script-Controlled ACL

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	ServiceNow Administrator / Security Engineer managing record access across enterprise departments.	Dynamically restrict access to sensitive ServiceNow records based on field values (e.g., state, confidentiality flag, department).	Standard role-based ACLs are static and apply unconditionally across the entire table without context-specific evaluations.	Role-based access controls lack granular field-level comparison and cannot execute custom server-side evaluation logic without scripting.	Concerned about compliance risks, frustrated by security gaps, and worried about unauthorized record visibility.
PS-2	Enterprise Process Owner / Department Manager handling confidential tickets.	Ensure team members only view and modify records matching their department or assigned status, restricting closed/sensitive files.	Unauthorized users can still discover sensitive record details through global search or list views.	Out-of-the-box condition builders cannot dynamically match user session attributes (gs.getUser()) against record fields on the fly.	Anxious about data privacy audit failures, stressed about confidential leaks, and lacking control over record exposure.

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-3	Support Fulfiller / System User working on assigned incident and request tickets.	Focus efficiently on assigned tasks without encountering list truncation errors or confusing access denials.	List views show unreadable 'Security constraints prevent viewing' notices or empty rows when ACLs block access.	Scripted ACLs restrict row-level access but require an aligned 'Before Query' Business Rule to seamlessly hide unauthorized rows from queries.	Confused by system security warnings, unproductive, and uncertain if critical work items are being hidden.
